Integration with Ignition

User must be an Admin.

1. Turn on Core API
   Sidebar → Labs → Core API → switch On
2. Create the app
   Settings → Developer hub → Create Core API app
   - Which API? → Core API (not Reporting API)
   - Name e.g. FireFly Client Portal
   - Paste the below Redirect URLs

Environment	Redirect URL to put in Ignition
Production	https://clientportal.fireflyaccountancy.com/api/ignition/callback
Local	http://localhost:3000/api/ignition/callback

3. Copy credentials immediately and then share.
   After create, Ignition shows:
   - Client ID → copy
   - Client secret → copy once and store safely (if lost → regenerate; old secret dies)
4. Usage/limits: Settings → Developer hub → Core API usage (Early access: free, ~1,000 requests/hour per app).

What "sync" can actually cover

Core API can sync things like clients, contacts, proposals, invoices, services (read/write).
It cannot sync payment records, deals/pipeline, forms, or file/PDF attachments.

Summary:

Please have an Ignition Admin: turn on Labs → Core API, create a Core API app in Settings → Developer hub named "FireFly Client Portal", add our redirect URL(s), then send us the Client ID and Client secret (secret is only shown once). We'll send a link for you to click Approve while signed in as the integration user.
